

T 5827 EN**Type 5827 Electric Actuator****Application**

Electric actuator designed for valves used in heating, ventilation and air-conditioning systems, process engineering and industrial energy transfer systems

Fig. 1: Type 5827 Electric Actuator

Special features

The linear actuator is particularly suitable for attachment to SAMSON Types 3260, 3222, 3226, 3213, 3214 and V2001 Valves. In addition, it can be used as an additional electric actuator on self-operated differential pressure and flow regulators.

- Actuator with or without fail-safe action
- Motor switched off by torque switches
- Manual override (handwheel, only version without fail-safe action)
- No maintenance

Versions

- Version with three-step signal
 - Synchronous motor with maintenance-free gearing
 - Synchronous motor with double stroking speed and maintenance-free gearing
- Digital positioner
 - Stepper motor with maintenance-free gearing
 - Adjustment of the direction of action at the actuator
 - Start-up at the actuator
 - Settings made using the TROVIS-VIEW software

Options

- Faster motor
 - Double stroking speed possible (version with three-step signal)
- Limit contacts
 - Two adjustable mechanical changeover switches
- Resistance transmitter
 - One resistance transmitter with a resistance range from 0 to 1000 Ω

Positioner/85 to 264 V AC			5

Design and principle of operation

The Type 5827 Electric Actuator is linear actuator, which is used in combination with SAMSON valves in industrial plants as well as in heating, ventilation and air-conditioning systems.

Depending on the actuator version, either a three-step signal or continuous signal issued by an electronic controller is used to control the electric actuator. The electric actuator consists of a reversible motor and a maintenance-free planetary gear with ball screw drive. The motor is switched off by torque switches in the end positions or in case of overload.

The force of the motor is transmitted to the actuator stem (3) via gearing and crank disk. When the actuator stem extends, the actuator piston (3) pushes against the valve's plug stem. When the actuator stem retracts (force-locking attachment), the plug stem follows the movement of the actuator stem as a result of the return spring in the valve.

When the actuator stem retracts (form-fit attachment), the plug stem is connected to the actuator stem and follows its movement.

Fig. 2: Design of Type 5827 (force-locking attachment)

- 1 Housing
- 1.1 Front housing cover
- 1.2 Cable entry
- 2 Handwheel (Type 5827-Nxx only)
- 2.1 Actuating shaft
- 3 Actuator stem with actuator piston
- 4 Coupling nut
- 5 Cam disk
- 6 Mechanical limit contacts
- 7.1 Adjuster for limit contact (bottom contact cam)
- 7.2 Adjuster for limit contact (top contact cam)
- 8 Spring assembly (Types 5827-Axx and 5827-Exx only)
- 9 Travel indication scale
- 9.1 Driving pin
- 10 Torque switch

Fail-safe action

The Type 5827 Actuator is available with fail-safe action. The actuators with fail-safe action have a spring assembly and an electromagnet. The actuator is moved by the force of the spring to the fail-safe position when the electromagnet is de-energized. The direction of action depends on the actuator version and cannot be reversed.

- **“Actuator stem extends” fail-safe action:**
The actuator stem extends upon supply voltage failure.
- **“Actuator stem retracts” fail-safe action:**
The actuator stem retracts upon supply voltage failure.

Electric actuators with fail-safe action do not have a handwheel. After disconnecting the supply voltage and opening the front housing cover, manual operation is possible with an Allen key. The actuator returns to its original position as soon as the Allen key is released.

Testing according to DIN EN 14597

Type 5827 Electric Actuators with "Actuator stem extends" fail-safe action which have a test mark on their nameplate are tested by the German technical surveillance association TÜV according to DIN EN 14597 in combination with different SAMSON valves (the register number is available on request).

Limit contacts

Optionally, the actuator can be equipped with two adjustable mechanical limit contacts. They are actuated by continuously adjustable cam disks. The actuator with positioner is only available with adjustable limit contacts in the version for 24 V AC/DC supply voltage.

It is not possible to retrofit limit contacts.

Version with three-step signal

A three-step signal issued by an electronic controller is used to control the electric actuator. The control signal of the controller is connected to the eL and aL terminals of the actuator. Voltage applied to eL causes the actuator motor to retract the actuator stem. Voltage applied to aL causes the actuator motor to extend the actuator stem. The motor is switched off by torque switches or in case of overload.

Actuator with faster motor

The Types 5827-x11, -x21 and -x31 Actuators are equipped with a faster motor in a housing attached to the back of the actuator.

Resistance transmitters

Optionally, the actuator can be equipped with a resistance transmitter. It consists of a potentiometer, which is linked to the gearing of the actuator over a gear wheel. It produces a resistance signal proportional to the travel. The resistance value, which is proportional to the valve travel, can be used for position feedback.

This version is always fitted with limit contacts as well.

Non-floating torque switches

The actuator version with three-step signal is equipped with two fixed torque switches.

They switch the control signal to a separate terminal after the end position is reached. This allows a further actuator to be controlled.

Version with digital positioner

The positioner ensures a predetermined assignment of the valve position to the control signal. For position feedback, a 0 to 10 V signal can be picked off at the output. The characteristic can be reversed. The actuator can be used for split-range operation.

- Automatic zero calibration after connecting the supply voltage
- Direction of action reversed by slide switch
- Momentary travel calculated based on the transit time
- Operating status and errors indicated by LEDs
- Adjustable stroking speed
- Blocking protection
- Adjustable input and output signal ranges
- Configuration, parameterization, diagnostic function and online connection for monitoring using the TROVIS-VIEW software
- Direct data transmission using a connecting cable (direct connection to computer)
- Data transmission over a memory pen

Settings

The digital positioner settings can be changed in the TROVIS-VIEW software.

Table 1: Settings with TROVIS-VIEW

Configuration	Default setting	Adjustment range
Input signal		
Lower range value	0.0 V 0.0 mA	0.0 to 7.5 V 0.0 to 15.0 mA
Upper range value	10.0 V 20.0 mA	2.5 to 10.0 V 5.0 to 20.0 mA
Unit	V	V/mA
Position feedback signal		
Lower range value	0.0 V	0.0 to 10.0 V
Upper range value	10.0 V	0.0 to 10.0 V
Functions		
Detect input signal failure	No	Yes/No
Positioning value upon input signal failure	Internal positioning value	Internal positioning value/last travel value
Internal positioning value	0.0 %	0.0 to 100 %
Value below limit (end position guiding)	1.0 %	0.0 to 49.9 %
Value above limit (end position guiding)	97.0 %	50.0 to 100.0 %
Blockage		
Blocking protection	No	Yes/No
Travel		
Limited travel range	100.0 %	30.0 to 100 %
Travel adjustment	Absolute	Absolute/Relative
Speed	Normal	Slow/Normal/Fast
Dead band (switching range)	2.0 %	0.5 to 5.0 %
Characteristic type	Linear	Linear/Equal percentage/Reverse equal percentage/User-defined

Replacement of old actuators with new actuators (valve is retained)

Old actuator		New actuator	
Type	5824-10	Type	5827-N1x
	5824-13 ¹⁾		5827-N1x
